

HEIDENHAIN

Rotary Encoders

November 2014

Rotary encoders from HEIDENHAIN

serve as measuring sensors for rotary motion, angular velocity, and when used in conjunction with mechanical measuring standards such as lead screws, for linear motion. Application areas include electrical motors, machine tools, printing machines, woodworking machines, textile machines, robots and handling devices, as well as various types of measuring, testing, and inspection devices.

The high quality of the sinusoidal incremental signals permits high interpolation factors for digital speed control.

Information on

- Encoders for servo drives
 - Angle encoders with integral bearing
 - Angle encoders without integral bearing
 - Modular magnetic encoders
 - Linear encoders for numerically controlled machine tools
 - Exposed linear encoders
 - Interface electronics
 - HEIDENHAIN controls
 - Interfaces of HEIDENHAIN Encoders
- is available upon request as well as on the Internet at www.heidenhain.de.

Comprehensive descriptions of all available interfaces as well as general electrical information are included in the *Interfaces for HEIDENHAIN Encoders* brochure, ID 1078628-xx.

This catalog supersedes all previous editions, which thereby become invalid. The basis for ordering from HEIDENHAIN is always the catalog edition valid when the contract is made.

Standards (ISO, EN, etc.) apply only where explicitly stated in the catalog.

Measuring principles

Measuring standards

HEIDENHAIN encoders with **optical scanning** incorporate measuring standards of periodic structures known as graduations. These graduations are applied to a carrier substrate of glass or steel.

These precision graduations are manufactured in various photolithographic processes. Graduations are fabricated from

- extremely hard chromium lines on glass
- matte-etched lines on gold-plated steel tape
- three-dimensional structures on glass or steel substrates

The photolithographic manufacturing processes developed by HEIDENHAIN produce grating periods of typically 50 μm to 4 μm .

These processes permit very fine grating periods and are characterized by a high definition and homogeneity of the line edges. Together with the photoelectric scanning method, this high edge definition is a precondition for the high quality of the output signals.

The master graduations are manufactured by HEIDENHAIN on custom-built high-precision dividing engines.

Encoders using the **inductive scanning principle** work with graduation structures of copper and nickel. The graduation is applied to a carrier material for printed circuits.

Measurement procedure

With the **absolute measuring method**, the position value is available from the encoder immediately upon switch-on and can be called at any time by the subsequent electronics. There is no need to move the axes to find the reference position. The absolute position information is read **from the graduated disk** which is formed from a serial absolute code structure.

A separate incremental track is interpolated for the position value and at the same time is used to generate an optional incremental signal.

In **singleturn encoders**, the absolute position information repeats itself with every revolution. **Multiturn encoders** can also distinguish between revolutions.

Circular graduations of absolute rotary encoders

With the **incremental measuring method**, the graduation consists of a periodic grating structure. The position information is obtained **by counting** the individual increments (measuring steps) from some point of origin. Since an absolute reference is required to ascertain positions, the graduated disks are provided with an additional track that bears a **reference mark**.

The absolute position established by the reference mark is gated with exactly one measuring step.

The reference mark must therefore be scanned to establish an absolute reference or to find the last selected datum.

Circular graduations of incremental rotary encoders

Scanning methods

Photoelectric scanning

Most HEIDENHAIN encoders operate using the principle of photoelectric scanning. Photoelectric scanning of a measuring standard is contact-free, and as such, free of wear. This method detects even very fine lines, no more than a few micrometers wide, and generates output signals with very small signal periods.

The ECN, EQN, ERN and ROC, ROQ, ROD rotary encoders use the imaging scanning principle.

To put it simply, the imaging scanning principle functions by means of projected-light signal generation: Two scale gratings, for example with equal or similar grating periods, are moved relative to each other—the scale and the scanning reticle. The carrier material of the scanning reticle is transparent. The graduation on the measuring standard can likewise be applied to a transparent surface, but also a reflective surface.

When parallel light passes through a grating, light and dark surfaces are projected at a certain distance. An index grating with the same grating period is located here. When the two gratings move relative to each other, the incident light is modulated. If the gaps in the gratings are aligned, light passes through. If the lines of one grating coincide with the gaps of the other, no light passes through. Photovoltaic cells convert these variations in light intensity into nearly sinusoidal electrical signals. Practical mounting tolerances for encoders with the imaging scanning principle are achieved with grating periods of 10 μm and larger.

Photoelectric scanning according to the imaging scanning principle

The absolute rotary encoders with optimized scanning have a single large photosensor instead of a group of individual photoelements. Its structures have the same width as that of the measuring standard. This makes it possible to do without the scanning reticle with matching structure.

Other scanning principles

ECI/EBI/EQI and RIC/RIQ rotary encoders operate according to the inductive measuring principle. Here, graduation structures modulate a high-frequency signal in its amplitude and phase. The position value is always formed by sampling the signals of all receiver coils distributed evenly around the circumference.

The accuracy of position measurement with rotary encoders is mainly determined by

- the directional deviation of the radial grating
- the eccentricity of the graduated disk to the bearing
- the radial runout of the bearing
- the error resulting from the connection with a shaft coupling (on rotary encoders with stator coupling this error lies within the system accuracy)
- the interpolation error during signal processing in the integrated or external interpolation and digitizing electronics

For **incremental rotary encoders** with line counts up to 5000:

The maximum directional deviation at 20 °C ambient temperature and slow speed (scanning frequency between 1 kHz and 2 kHz) lies within

$$\pm \frac{18^\circ \text{ mech.} \cdot 3600}{\text{Line count } z} \text{ [angular seconds]}$$

which equals

$$\pm \frac{1}{20} \text{ grating period.}$$

ROD rotary encoders generate 6000 to 10000 signal periods per revolution through signal doubling. The line count is important for the system accuracy.

The accuracy of absolute position values from **absolute rotary encoders** is given in the specifications for each model.

For absolute rotary encoders with **complementary incremental signals**, the accuracy depends on the line count:

Line count	Accuracy
16	± 280 angular seconds
32	± 180 angular seconds
512	± 60 angular seconds
2048	± 20 angular seconds
2048	± 10 angular seconds (ROC 425 with high accuracy)

The above accuracy data refer to incremental measuring signals at an ambient temperature of 20 °C and at slow speed.

Mechanical design types and mounting

Rotary encoders with stator coupling

ECN/EQN/ERN rotary encoders have integrated bearings and a mounted stator coupling. The stator coupling compensates radial runout and alignment errors without significantly reducing the accuracy. The encoder shaft is directly connected with the shaft to be measured. During angular acceleration of the shaft, the stator coupling must absorb only that torque caused by friction in the bearing. The stator coupling permits axial motion of the measured shaft:

ECN/EQN/ERN 400: ± 1 mm

ECN/EQN/ERN 1000: ± 0.5 mm

ECN/ERN 100: ± 1,5 mm

Mounting

The rotary encoder is slid by its hollow shaft onto the measured shaft, and the rotor is fastened by two screws or three eccentric clamps. For rotary encoders with hollow through shaft, the rotor can also be fastened at the end opposite to the flange. Rotary encoders of the ECN/EQN/ERN 1300 series with taper shaft are particularly well suited for repeated mounting (see catalog titled *Position Encoders for Servo Drives*). The stator is connected without a centering collar on a flat surface. The **universal stator coupling** of the ECN/EQN/ERN400 permits versatile mounting, e.g. by its thread provided for fastening it from outside to the motor cover.

Dynamic applications require the highest possible natural frequencies f_N of the system (also see *General mechanical information*). This is attained by connecting the shafts on the flange side and fastening the coupling by four cap screws or, on the ECN/EQN/ERN 1000, with special washers.

Natural frequency f_N with coupling fastened by 4 screws

	Stator coupling	Cable	Flange socket	
			Axial	Radial
ECN/EQN/ERN 400	Standard Universal	1550 Hz 1400 Hz ¹⁾	1500 Hz 1400 Hz	1000 Hz 900 Hz
ECN/ERN 100		1000 Hz	–	400 Hz
ECN/EQN/ERN 1000		1500 Hz ²⁾	–	–

¹⁾ Also when fastening with 2 screws

²⁾ Also when fastening with 2 screws and washers

Mounting accessories

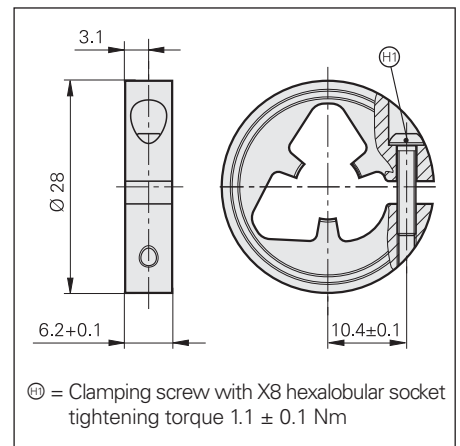

Washer

For ECN/EQN/ERN 1000
For increasing the natural frequency f_N
when mounting with only two screws.
ID 334653-01

Shaft clamp ring

for ECN/EQN/ERN 400
By using a second shaft clamp ring, the
mechanically permissible speed of rotary
encoders with hollow through shaft can be
increased to a maximum of $12\,000\text{ min}^{-1}$.
ID 540741-xx

If the encoder shaft is subject to **high loads**,
for example from friction wheels, pulleys,
or sprockets, HEIDENHAIN recommends
mounting the ECN/EQN/ERN 400 with a
bearing assembly.

Bearing assembly

For ECN/EQN/ERN 400
With blind hollow shaft
ID 574185-03

	Bearing assembly
Permissible speed n	$\leq 6000\text{ min}^{-1}$
Shaft load	Axial: 150 N; radial: 350 N
Operating temperature	$-40\text{ °C to }+100\text{ °C}$
Protection (EN 60529)	IP 64

The bearing assembly is capable of absorbing
large radial shaft loads. It prevents overload
of the encoder bearing. On the encoder
side, the bearing assembly has a stub shaft
with 12 mm diameter and is well suited for
the ECN/EQN/ERN 400 encoders with
blind hollow shaft. Also, the threaded holes
for fastening the stator coupling are already
provided. The flange of the bearing assembly
has the same dimensions as the clamping
flange of the ROD 420/430 series. The
bearing assembly can be fastened through
the threaded holes on its face or with the
aid of the mounting flange or the mounting
bracket (see page 19).

Torque supports for ECN/EQN/ERN 400

For simple applications with the ECN/EQN/ERN 400, the stator coupling can be replaced by torque supports. The following kits are available:

Wire torque support

The stator coupling is replaced by a metal plate to which the provided wire is fastened as coupling.
ID 510955-01

Pin torque support

Instead of a stator coupling, a "synchro flange" is fastened to the encoder. A pin serving as torque support is mounted either axially or radially on the flange. As an alternative, the pin can be pressed in on the customer's surface, and a guide can be inserted in the encoder flange for the pin.

Rotary encoders for separate shaft coupling

ROC/ROQ/ROD and **RIC/RIQ** rotary encoders have integrated bearings and a solid shaft. The encoder shaft is connected with the measured shaft through a separate rotor coupling. The coupling compensates axial motion and misalignment (radial and angular offset) between the encoder shaft and measured shaft. This relieves the encoder bearing of additional external loads that would otherwise shorten its service life. Diaphragm and metal bellows couplings designed to connect the rotor of the ROC/ROQ/ROD/RIC/RIQ encoders are available (see *Shaft couplings*).

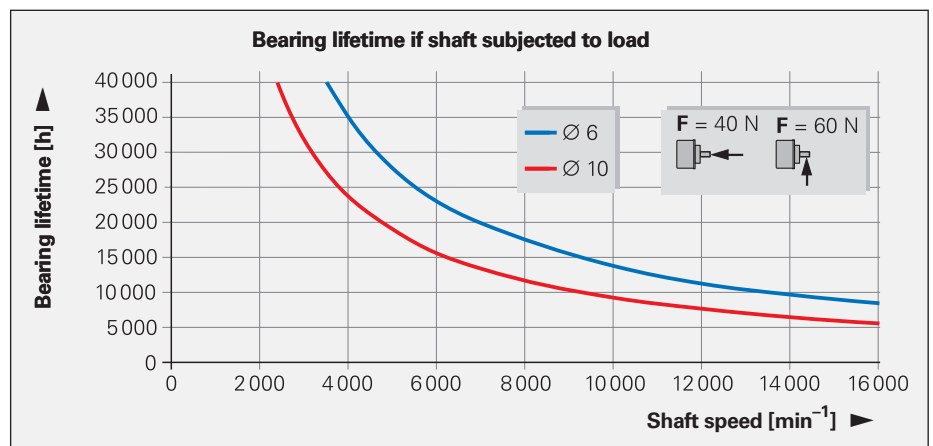

ROC/ROQ/ROD 400 and RIC/RIQ 400 series rotary encoders permit high bearing loads (see diagram). They can therefore also be mounted directly onto mechanical transfer elements such as gears or friction wheels.

If the encoder shaft is subject to relatively high loads, for example from friction wheels, pulleys, or sprockets, HEIDENHAIN recommends mounting the ECN/EQN/ERN 400 with a bearing assembly. The ROD 1930 is offered for very high bearing loads.

Bearing service life of ROC/ROQ/ROD 400 and RIC/RIQ 400

The service life to be expected of the bearings depends on the shaft load, the force application point, and the shaft speed. The maximum permissible load of the shaft at shaft end is listed in the *Specifications*. The relationship between the bearing service life and the shaft speed at maximum shaft load is illustrated in the diagram for the shaft diameters 6 mm and 10 mm. With a load of 10 N axially and 20 N radially at the shaft end, the expected bearing service life at maximum shaft speed is more than 40000 hours.

Bearing service life of ROD 1930

The ROD 1930 is designed for very high bearing loads together with long service life.

Rotary encoders with synchro flange

Mounting

- By the synchro flange with three fixing clamps, or
- by fastening threaded holes on the encoder flange to an adapter flange (for ROC/ROQ/ROD 400 or RIC/RIQ 400).

Mechanical fault exclusion is possible after consultation with HEIDENHAIN in Traunreut, Germany.

Safety-related position encoders

Under the term **functional safety**, HEIDENHAIN offers encoders that can be used in safety-related applications. These encoders operate as single-encoder systems with purely serial data transmission via EnDat 2.2. Reliable transmission of the position is based on two independently generated absolute position values and on error bits, which are then provided to the safe control.

Basic principle

HEIDENHAIN encoders for safety-related applications are tested for compliance with EN ISO 13849-1 (successor to EN 954-1) as well as EN 61 508 and EN 61 800-5-2. These standards describe the assessment of safety-oriented systems, for example based on the failure probabilities of integrated components and subsystems. This modular approach helps manufacturers of safety-oriented systems to implement their complete systems, because they can begin with subsystems that have already been qualified. Safety-related position measuring systems with purely serial data transmission via EnDat 2.2 accommodate this technique. In a safe drive, the safety-related position measuring system is such a subsystem. A **safety-related position measuring system** consists of:

- Encoder with EnDat 2.2 transmission component
- Data transfer line with EnDat 2.2 communication and HEIDENHAIN cable
- EnDat 2.2 receiver component with monitoring function (EnDat master)

In practice, the **complete "safe servo drive" system** consists of:

- Safety-related position measuring system
- Safety-related control (including EnDat master with monitoring functions)
- Power stage with motor power cable and drive
- Mechanical connection between encoder and drive (e.g. rotor/stator connection)

Area of application

Safety-related position measuring systems from HEIDENHAIN are designed so that they can be used as single-encoder systems in applications with control category SIL 2 (according to EN 61 508), performance level "d", category 3 (according to EN ISO 13849).

Additional measures in the control make it possible to use certain encoders for applications up to SIL 3, PL "e", category 4. The suitability of these encoders is indicated appropriately in the documentation (catalogs / product information sheets).

The functions of the safety-related position measuring system can be used for the following safety tasks in the complete system (also see EN 61 800-5-2):

SS1	Safe Stop 1	Safe stop 1
SS2	Safe Stop 2	Safe stop 2
SOS	Safe Operating Stop	Safe operating stop
SLA	Safely Limited Acceleration	Safely limited acceleration
SAR	Safe Acceleration Range	Safe acceleration range
SLS	Safely Limited Speed	Safely limited speed
SSR	Safe Speed Range	Safe speed range
SLP	Safely Limited Position	Safely limited position
SLI	Safely Limited Increment	Safely limited increment
SDI	Safe Direction	Safe direction
SSM	Safe Speed Monitor	Safe report of the limited speed

Safety functions according to EN 61 800-5-2

Complete safe drive system

Function

The safety strategy of the position measuring system is based on two mutually independent position values and additional error bits produced in the encoder and transmitted over the EnDat 2.2 protocol to the EnDat master. The EnDat master assumes various monitoring functions with which errors in the encoder and during transmission can be revealed. For example, the two position values are then compared. The EnDat master then makes the data available to the safe control. The control periodically tests the safety-related position measuring system to monitor its correct operation.

The architecture of the EnDat 2.2 protocol makes it possible to process all safety-relevant information and control mechanisms during unconstrained controller operation. This is possible because the safety-relevant information is saved in the additional information. According to EN 61 508, the architecture of the position measuring system is regarded as a single-channel tested system.

Documentation on the integration of the position measuring system

The intended use of position measuring systems places demands on the control, the machine designer, the installation technician, service, etc. The necessary information is provided in the documentation for the position measuring systems.

In order to be able to implement a position measuring system in a safety-related application, a suitable control is required. The control assumes the fundamental task of communicating with the encoder and safely evaluating the encoder data.

The requirements for integrating the EnDat master with monitoring functions into the safe control are described in the HEIDENHAIN document 533095. It contains, for example, specifications on the evaluation and processing of position values and error bits, and on electrical connection and cyclic tests of position measuring systems.

Document 1000344 describes additional measures that make it possible to use suitable encoders for applications up to SIL 3, PL "e," category 4.

Machine and plant manufacturers need not attend to these details. These functions must be provided by the control. Product information sheets, catalogs and mounting instructions provide information to aid the selection of a suitable encoder. The **product information sheets** and **catalogs** contain general data on function and application of the encoders as well as specifications and permissible ambient conditions. The **mounting instructions** provide detailed information on installing the encoders.

The architecture of the safety system and the diagnostic possibilities of the control may call for further requirements. **For example, the operating instructions of the control must explicitly state whether fault exclusion is required for the loosening of the mechanical connection between the encoder and the drive.** The machine designer is obliged to inform the installation technician and service technicians, for example, of the resulting requirements.

Safety-related position measuring system

For more information on the topic of functional safety, refer to the technical information documents *Safety-Related Position Measuring Systems* and *Safety-Related Control Technology* as well as the product information document of the functional safety encoders.

General mechanical information

Certified by Nationally Recognized Testing Laboratory (NRTL)

All rotary encoders in this brochure comply with the UL safety regulations for the USA and the "CSA" safety regulations for Canada.

Acceleration

Encoders are subject to various types of acceleration during operation and mounting.

• Vibration

The encoders are qualified on a test stand to operate with the acceleration values listed in the Specifications at frequencies from 55 to 2000 Hz in accordance with EN 60068-2-6. However, if the application or poor mounting causes long-lasting resonant vibration, it can limit performance or even damage the encoder. **Comprehensive tests of the entire system are therefore required.**

• Shock

On a test stand for non-repetitive semi-sinusoidal shock, the encoders are qualified for acceleration values and durations listed in the Specifications in accordance with EN 60068-2-27. This does not include **permanent shock loads, which must be tested in the application.**

- The **maximum angular acceleration** is 10^5 rad/s^2 (DIN 32878). This is the highest permissible acceleration at which the rotor will rotate without damage to the encoder. The actually attainable angular acceleration lies in the same order of magnitude (for deviating values for ECN/ERN 100 see *Specifications*), but it depends on the type of shaft connection. A sufficient safety factor is to be determined through system tests.

Other values for rotary encoders with functional safety are provided in the corresponding product information documents.

Humidity

The max. permissible relative humidity is 75%. 93% is permissible temporarily. Condensation is not permissible.

Magnetic fields

Magnetic fields > 30 mT can impair proper function of encoders. If required, please contact HEIDENHAIN, Traunreut.

RoHS

HEIDENHAIN has tested the products for harmlessness of the materials as per European Directives 2002/95/EC (RoHS) and 2002/96/EC (WEEE). For a Manufacturer's Declaration on RoHS, please refer to your sales agency.

Natural frequencies

The rotor and the couplings of ROC/ROQ/ROD and RIC/RIQ rotary encoders, as also the stator and stator coupling of ECN/EQN/ERN rotary encoders, form a single vibrating spring-mass system.

The **natural frequency f_N** should be as high as possible. A prerequisite for the highest possible natural frequency on **ROC/ROQ/ROD/RIC/RIQ rotary encoders** is the use of a diaphragm coupling with a high torsional rigidity C (see *Shaft couplings*).

$$f_N = \frac{1}{2 \cdot \pi} \cdot \sqrt{\frac{C}{I}}$$

f_N : Natural frequency of the coupling in Hz
C: Torsional rigidity of the coupling in Nm/rad
I: Moment of inertia of rotor in kgm^2

ECN/EQN/ERN rotary encoders with their stator couplings form a vibrating spring-mass system whose **natural frequency f_N of the coupling** should be as high as possible. If radial and/or axial acceleration forces are added, the rigidity of the encoder bearings and the encoder stators is also significant. If such loads occur in your application, HEIDENHAIN recommends consulting with the main facility in Traunreut.

Protection against contact (EN 60529)

After encoder installation, all rotating parts must be protected against accidental contact during operation.

Protection (EN 60 529)

The ingress of contamination can impair proper function of the encoder. Unless otherwise indicated, all rotary encoders meet protection standard IP 64 (ExN/ROx 400: IP 67) according to EN 60529. This includes housings, cable outlets and flange sockets when the connector is fastened.

The **shaft inlet** provides protection to IP 64. Splash water should not contain any substances that would have harmful effects on the encoder's parts. If the protection of the shaft inlet is not sufficient (such as when the encoders are mounted vertically), additional labyrinth seals should be provided. Many encoders are also available with protection to class IP 66 for the shaft inlet. The sealing rings used to seal the shaft are subject to wear due to friction, the amount of which depends on the specific application.

Noise emission

Running noise can occur during operation, particularly when encoders with integral bearing or multiturn rotary encoders (with gears) are used. The intensity may vary depending on the mounting situation and the speed.

Conditions for longer storage times

HEIDENHAIN recommends the following in order to make storage times beyond 12 months possible:

- Leave the encoders in the original packaging.
- The storage location should be dry, free of dust, and temperature-regulated. It should also not be subjected to vibrations, mechanical shock or chemical influences.
- For encoders with integral bearing, every 12 months (e.g. as run-in period) the shaft should be turned at low speeds, without axial or radial loads, so that the bearing lubricant redistributes itself evenly again.

Expendable parts

Encoders from HEIDENHAIN are designed for a long service life. Preventive maintenance is not required. However, they contain components that are subject to wear, depending on the application and manipulation. These include in particular cables with frequent flexing.

Other such components are the bearings of encoders with integral bearing, shaft sealing rings on rotary and angle encoders, and sealing lips on sealed linear encoders.

Insulation

The encoder housings are isolated against internal circuits.

Rated surge voltage: 500 V

Preferred value as per DIN EN 60664-1

Overvoltage category II

Contamination level 2

(no electrically conductive contamination).

System tests

Encoders from HEIDENHAIN are usually integrated as components in larger systems. Such applications require **comprehensive tests of the entire system** regardless of the specifications of the encoder.

The specifications shown in this brochure apply to the specific encoder, not to the complete system. Any operation of the encoder outside of the specified range or for any other than the intended applications is at the user's own risk.

Assembly

Work steps to be performed and dimensions to be maintained during mounting are specified solely in the mounting instructions supplied with the unit. All data in this catalog regarding mounting are therefore provisional and not binding; they do not become terms of a contract.

Rotary encoders with functional safety

Mounting screws and central screws from HEIDENHAIN (not included in delivery) feature a coating which, after hardening, provides a materially bonding anti-rotation lock. Therefore the screws cannot be reused. The minimum shelf life is 2 years (storage at $\leq 30\text{ }^{\circ}\text{C}$ and $\leq 65\%$ relative humidity). The expiration date is printed on the package.

Screw insertion and application of tightening torque must therefore take no longer than 5 minutes. The required adhesive strength is attained after about 6 hours at room temperature. The curing time decreases with decreasing temperature. Hardening temperatures below $5\text{ }^{\circ}\text{C}$ are not permissible. Screws with materially bonding anti-rotation lock must not be used more than once. In case of replacement, recut the threads and use new screws. A chamfer is required on threaded holes to prevent any scraping off of the adhesive layer.

Changes to the encoder

The correct operation and accuracy of encoders from HEIDENHAIN is ensured only if they have not been modified. Any changes, even minor ones, can impair the operation and reliability of the encoders, and result in a loss of warranty. This also includes the use of additional retaining compounds, lubricants (e.g. for screws) or adhesives not explicitly prescribed. In case of doubt, we recommend contacting HEIDENHAIN in Traunreut.

Temperature ranges

For the encoder in its packaging, the **storage temperature** is from $-30\text{ }^{\circ}\text{C}$ to $65\text{ }^{\circ}\text{C}$ (HR 1120: $-30\text{ }^{\circ}\text{C}$ to $70\text{ }^{\circ}\text{C}$). The **operating temperature range** indicates the temperatures that the encoder may reach during operation in the actual installation environment. The function of the encoder is guaranteed within this range (DIN 32878). The operating temperature is measured on the defined encoder (see dimension drawing) and must not be confused with the ambient temperature.

The temperature of the encoder is influenced by:

- Mounting conditions
- The ambient temperature
- Self-heating of the encoder

The self-heating of an encoder depends both on its design characteristics (stator coupling/solid shaft, shaft sealing ring, etc.) and on the operating parameters (rotational speed, power supply). Temporarily increased self-heating can also occur after very long breaks in operation (of several months). Please take a two-minute run-in period at low speeds into account. Higher heat generation in the encoder means that a lower ambient temperature is required to keep the encoder within its permissible operating temperature range.

These tables show the approximate values of self-heating to be expected in the encoders. In the worst case, a combination of operating parameters can exacerbate self-heating, for example a 30 V power supply and maximum rotational speed. Therefore, the actual operating temperature should be measured directly at the encoder if the encoder is operated near the limits of permissible parameters. Then suitable measures should be taken (fan, heat sinks, etc.) to reduce the ambient temperature far enough so that the maximum permissible operating temperature will not be exceeded during continuous operation.

For high speeds at maximum permissible ambient temperature, special versions are available on request with reduced degree of protection (without shaft seal and its concomitant frictional heat).

Heat generation at speed n_{\max}

<i>Stub shaft/tapered shaft</i> ROC/ROQ/ROD/ RIC/RIQ/ ExN 400/1300	Approx. + 5 K Approx. + 10 K with IP 66 protection
<i>Blind hollow shaft</i> ECN/EQN/ ERN 400/1300	Approx. + 30 K Approx. + 40 K with IP 66 protection
ECN/EQN/ ERN 1000	Approx. + 10 K
<i>Hollow through shaft</i> ECN/ERN 100 ECN/EQN/ERN 400	Approx. + 40 K with IP 64 protection Approx. + 50 K with IP 66 protection

An encoder's typical self-heating values depend on its design characteristics at maximum permissible speed. The correlation between rotational speed and heat generation is nearly linear.

Measuring the actual operating temperature at the defined measuring point of the rotary encoder (see *Specifications*)

Weight	≈ 0.18 kg

Mounting information

The HR 1120 is designed for mounting in a panel. CE compliance of the complete system must be ensured by taking the correct measures during installation.

Interfaces

Incremental signals $\sim 1 V_{PP}$

HEIDENHAIN encoders with $\sim 1 V_{PP}$ interface provide voltage signals that can be highly interpolated.

The sinusoidal **incremental signals** A and B are phase-shifted by 90° elec. and have amplitudes of typically $1 V_{PP}$. The illustrated sequence of output signals—with B lagging A—applies for the direction of motion shown in the dimension drawing.

The **reference mark signal** R has an unambiguous assignment to the incremental signals. The output signal might be somewhat lower next to the reference mark.

The *Interfaces of HEIDENHAIN Encoders* brochure, ID 1078628-xx, includes comprehensive descriptions of all available interfaces as well as general electrical information.

Pin layout

12-pin coupling, M23					12-pin connector, M23								
Voltage supply					Incremental signals						Other signals		
	12	2	10	11	5	6	8	1	3	4	9	7	/

Cable shield connected to housing; U_P = Power supply voltage

Sensor: The sensor line is connected in the encoder with the corresponding voltage supply.

Vacant pins or wires must not be used!

¹⁾ **LIDA 2xx:** Vacant

Incremental signals \square TTL

HEIDENHAIN encoders with \square TTL interface incorporate electronics that digitize sinusoidal scanning signals with or without interpolation.

The **incremental signals** are transmitted as the square-wave pulse trains U_{a1} and U_{a2} , phase-shifted by 90° elec. The **reference mark signal** consists of one or more reference pulses U_{a0} , which are gated with the incremental signals. In addition, the integrated electronics produce their **inverted signals** $\overline{U_{a1}}$, $\overline{U_{a2}}$ and $\overline{U_{a0}}$ for noise-proof transmission. The illustrated sequence of output signals—with U_{a2} lagging U_{a1} —applies to the direction of motion shown in the dimension drawing.

The **fault detection signal** $\overline{U_{aS}}$ indicates fault conditions such as an interruption in the supply lines, failure of the light source, etc.

The distance between two successive edges of the incremental signals U_{a1} and U_{a2} through 1-fold, 2-fold or 4-fold evaluation is one **measuring step**.

The *Interfaces of HEIDENHAIN Encoders* brochure, ID 1078628-xx, provides comprehensive descriptions of all available interfaces as well as general electrical information.

⁽²⁾ Exposed linear encoders: Conversion of TTL/11 μA_{PP} for PWT

HR pin layout

Screw-terminal connection							
Voltage supply			Incremental signals				
+		-	A	\overline{A}	B	\overline{B}	
Signal		U_P 5V	U_N 0V	U_{a1}	$\overline{U_{a1}}$	U_{a2}	$\overline{U_{a2}}$

A shielded cable with a cross section of at least 0.5 mm^2 is recommended when connecting the handwheel to the power supply.

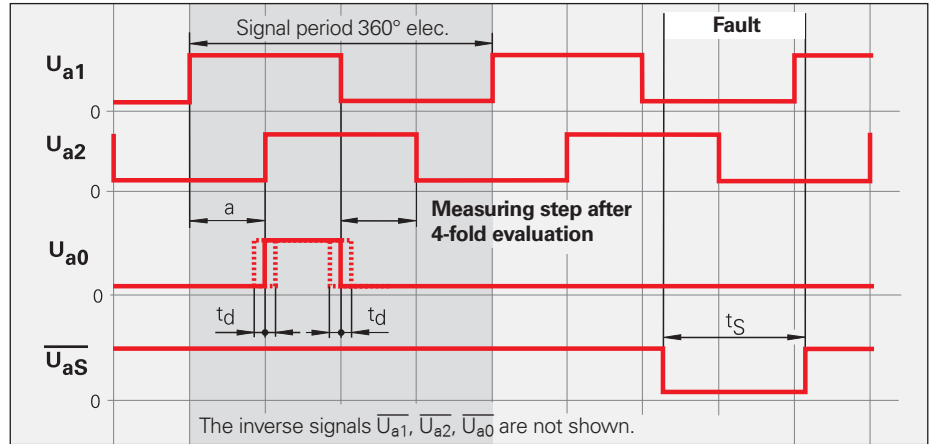

The handwheel is connected electrically via screw terminals. The appropriate wire end sleeves must be attached to the wires.

Incremental signals HTL, HTLs

HEIDENHAIN encoders with  HTL interface incorporate electronics that digitize sinusoidal scanning signals with or without interpolation.

The **incremental signals** are transmitted as the square-wave pulse trains U_{a1} and U_{a2} , phase-shifted by 90° elec. The **reference mark signal** consists of one or more reference pulses U_{a0} , which are gated with the incremental signals. In addition, the integrated electronics produce their **inverted signals** $\overline{U_{a1}}$, $\overline{U_{a2}}$ and $\overline{U_{a0}}$ for noise-proof transmission (does not apply to HTLs). The illustrated sequence of output signals—with U_{a2} lagging U_{a1} —applies to the direction of motion shown in the dimension drawing.

The **fault detection signal** $\overline{U_{aS}}$ indicates fault conditions, for example a failure of the light source.

The distance between two successive edges of the incremental signals U_{a1} and U_{a2} through 1-fold, 2-fold or 4-fold evaluation is one **measuring step**.

Comprehensive descriptions of all available interfaces as well as general electrical information are included in the *Interfaces* catalog ID 1078628-xx.

Pin layout

A shielded cable with a cross section of at least 0.5 mm^2 is recommended when connecting to the power supply. The encoder is connected through screw terminals. The appropriate wire end sleeves must be attached to the wires.

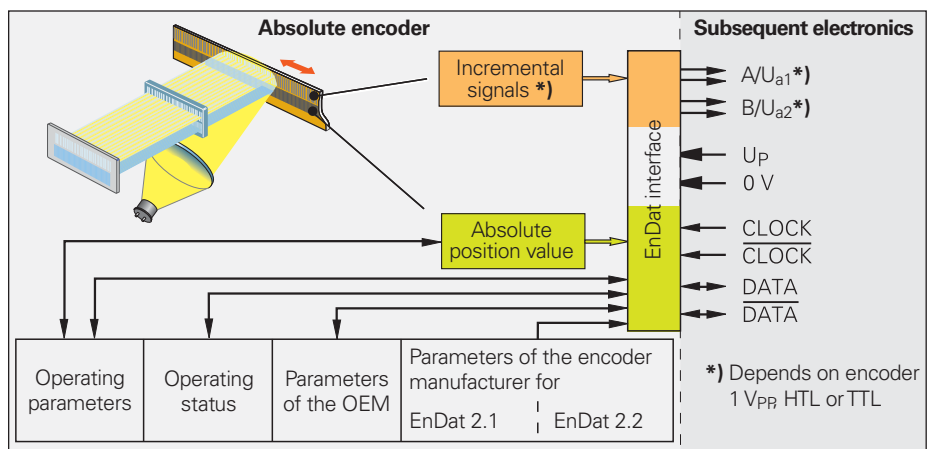

Position values

The EnDat interface is a digital, **bidirectional** interface for encoders. It is capable both of transmitting **position values** as well as transmitting or updating information stored in the encoder, or saving new information. Thanks to the **serial transmission method**, only **four signal lines** are required. The DATA is transmitted in **synchronism** with the CLOCK signal from the subsequent electronics. The type of transmission (position values, parameters, diagnostics, etc.) is selected through mode commands that the subsequent electronics send to the encoder. Some functions are available only with EnDat 2.2 mode commands.

Ordering designation	Command set	Incremental signals
EnDat01 EnDatH EnDatT	EnDat 2.1 or EnDat 2.2	1 V _{PP} HTL TTL
EnDat21		–
EnDat02	EnDat 2.2	1 V _{PP}
EnDat22	EnDat 2.2	–

Versions of the EnDat interface

Comprehensive descriptions of all available interfaces as well as general electrical information are included in the *Interfaces for HEIDENHAIN Encoders* brochure, ID 1078628-xx.

PROFIBUS-DP position values

PROFIBUS-DP

The PROFIBUS is a non-proprietary, open fieldbus according to the international standard EN 50170. The connecting of sensors through fieldbus systems minimizes the cost of cabling and reduces the number of lines between encoder and subsequent electronics.

PROFIBUS-DP profile

The PNO (PROFIBUS user organization) has defined standard, nonproprietary profiles for the connection of absolute encoders to the PROFIBUS-DP. This ensures high flexibility and simple configuration on all systems that use these standardized profiles.

Encoders with PROFIBUS-DP

The absolute rotary encoders with **integrated PROFIBUS-DP interface** are connected directly to the PROFIBUS.

Accessories

Adapter connector M12 (male) 4-pin, B-coded, fits 5-pin bus output, with PROFIBUS terminating resistor. Required for last participant if the encoder's internal terminating resistor is not to be used. ID 584217-01

Mating connectors are required for connection via M12 connecting element:

Bus input

M12 connector (female), 5-pin, B-coded

Bus output

M12 coupling (male), 5-pin, B-coded

Voltage supply

M12 connector, 4-pin, A-coded

Connection via M12 connecting element

Connection via M16 cable gland

The *Interfaces of HEIDENHAIN Encoders* brochure, ID 1078628-xx, provides comprehensive descriptions of all available interfaces as well as general electrical information.

PROFINET IO position values

PROFINET IO

PROFINET IO is the open Industrial Ethernet Standard for industrial communication. It builds on the field-proven function model of PROFIBUS-DP, but uses fast Ethernet technology as physical transmission medium and is therefore tailored for fast transmission of I/O data. It offers the possibility of transmission for required data, parameters and IT functions at the same time.

PROFINET profile

HEIDENHAIN encoders fulfill the definitions as per Profile 3.162, Version 4.1. The device profile describes the encoder functions. Class 4 (full scaling and preset) functions are supported. More detailed information on PROFINET can be ordered from the PROFIBUS user organization PNO.

Commissioning

To put an encoder with a PROFINET interface into operation, a device identification record (GSD) must be downloaded and imported into the configuration software. The GSD contains the execution parameters required for a PROFINET-IO device.

Encoders with PROFINET

The absolute rotary encoders with integrated PROFINET interface are connected directly to the network. Addresses are distributed automatically over a protocol integrated in PROFINET. A PROFINET-IO field device is addressed within a network through its physical device MAC address.

On their rear faces, the encoders feature two double-color LEDs for diagnostics of the bus and the device.

Connection

PROFINET and the power supply are connected via the M12 connecting elements. The necessary mating connectors are:

Ports 1 and 2

M12 coupling (male), 4-pin, D-coded

Voltage supply

M12 connector, 4-pin, A-coded

Pin layout

Ports 1 and 2 4-pin connector (female) M12 D-coded

	U_P	0V	Vacant	Vacant

The *Interfaces of HEIDENHAIN Encoders* brochure, ID 1078628-xx, provides comprehensive descriptions of all available interfaces as well as general electrical information.

SSI position values

The **position value** beginning with the Most Significant Bit (MSB first) is transferred on the DATA lines in synchronism with a CLOCK signal transmitted by the control. The SSI standard data word length for singleturn encoders is 13 bits, and for multiturn encoders 25 bits. In addition to the absolute position values, **incremental signals** can also be transmitted. For signal description see *Incremental signal 1 V_{PP}*.

The following **functions** can be activated through programming inputs:

- **Direction of rotation**
- **Zero reset** (setting to zero)

Data transfer

$T = 1$ to $10 \mu\text{s}$
 t_{cal} See *Specifications*
 $t_1 \leq 0,4 \mu\text{s}$
 (w/o cable)
 $t_2 = 17$ to $20 \mu\text{s}$
 $t_R \geq 5 \mu\text{s}$
 $n =$ Data word length
 13 bits for ECN/ROC
 25 bits for EQN/ROQ

CLOCK and DATA not shown

Comprehensive descriptions of all available interfaces as well as general electrical information are included in the *Interfaces* catalog ID 1078628-xx.

Diagnostic and testing equipment

HEIDENHAIN encoders are provided with all information necessary for commissioning, monitoring and diagnostics. The type of available information depends on whether the encoder is incremental or absolute and which interface is used.

Incremental encoders mainly have 1 V_{PP} TTL or HTL interfaces. TTL and HTL encoders monitor their signal amplitudes internally and generate a simple fault detection signal. With 1 V_{PP} signals, the analysis of output signals is possible only in external test devices or through computation in the subsequent electronics (analog diagnostics interface).

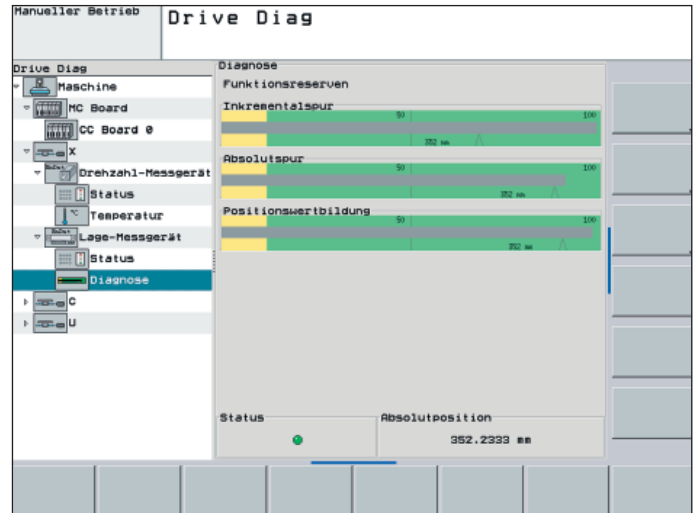

Absolute encoders operate with serial data transfer. Depending on the interface, additional 1 V_{PP} incremental signals can be output. The signals are monitored comprehensively within the encoder. The monitoring result (especially with valuation numbers) can be transferred along with the position value through the serial interface to the subsequent electronics (digital diagnostics interface). The following information is available:

- Error message: Position value is not reliable.
- Warning message: An internal functional limit of the encoder has been reached.
- Valuation numbers:
 - Detailed information on the encoder's functional reserve
 - Identical scaling for all HEIDENHAIN encoders
 - Cyclic output is possible

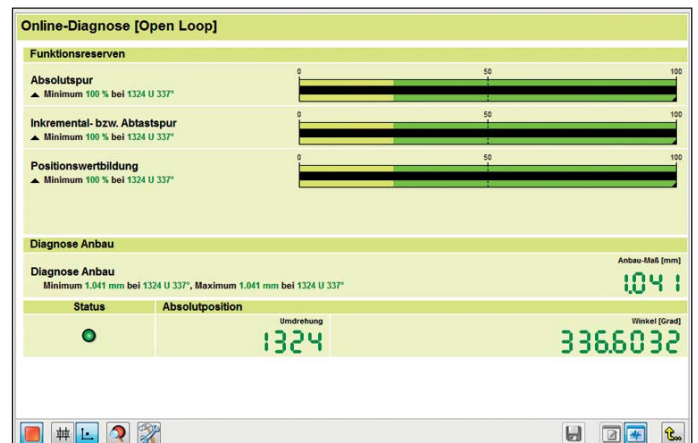

This enables the subsequent electronics to evaluate the current status of the encoder at little cost even in closed-loop mode.

HEIDENHAIN offers the appropriate PWM inspection devices and PWT test devices for encoder analysis. There are two types of diagnostics, depending on how they are integrated:

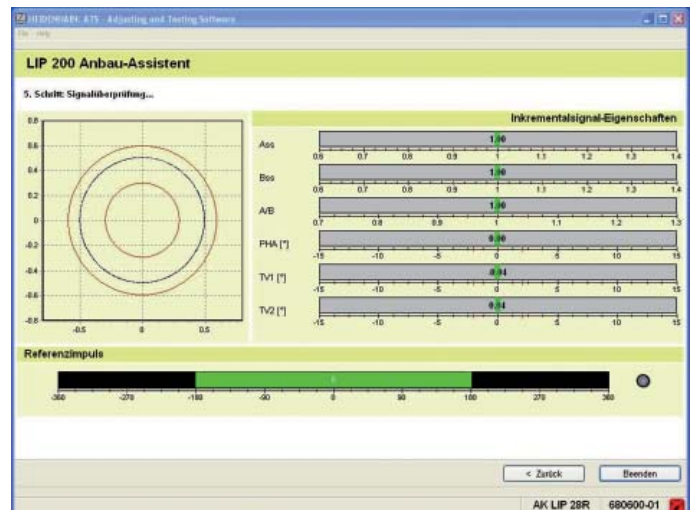

- Encoder diagnostics: The encoder is connected directly to the test or inspection device. This makes a comprehensive analysis of encoder functions possible.
- Diagnostics in the control loop: The PWM 20 is looped into the closed control loop (e.g. through a suitable testing adapter). This makes a real-time diagnosis of the machine or system possible during operation. The functions depend on the interface.

Diagnostics in the control loop on HEIDENHAIN controls with display of the valuation number or the analog encoder signals

Diagnostics using PWM 20 and ATS software

Commissioning using PWM 20 and ATS software

PWM 20

The PWM 20 phase angle measuring unit serves together with the provided ATS adjusting and testing software for diagnosis and adjustment of HEIDENHAIN encoders.

For more information, refer to the Product Information document *PWM 20/ATS Software*.
